Job Market Paper

Spillover Effect of Mass Layoffs on Neighboring Firms

This paper examines the spillover effects of mass layoffs on neighboring establishments, shedding light on the dynamics of agglomeration economies. Leveraging comprehensive administrative data encompassing all entities in California, I study the indirect effects of mass layoffs on employment, earnings, and the number of nearby establishments. I exploit the geographic coordinates of establishments to define treatment and control areas based on their proximity to instances of mass layoffs. The findings reveal persistent and negative spillover effects on local employment levels four years after the events and a net decrease in operating establishments. However, there is no significant change in average earnings of workers. Furthermore, empirical evidence demonstrates that the spillover effects diminish with increasing spatial distance, effectively disappearing after 6km. Ultimately, I show industries closely interlinked to the event establishment exhibit more pronounced employment loss.
